The LCR featured an aluminum upper and a glass filled polymer lower. The arrow is pointing at one of the pins that hold the upper and lower together.

The front sight was pinned into place rather than machined as one with the aluminum shroud.

The cylinder was fluted, meaning the outer surface was contoured to match the inner diameter of each chamber. The reduction in weight helped lower

the "flywheel" effect or inertia, the amount of energy needed to start and stop rotation. Note that the strength of the cylinder was preserved by maintaining full diameter where chamber pressure reaches its highest point at the casing base (arrow).
